

Agentic Tele-Medical Underwriting | Executive Architecture One-Pager

Business Objective: Reduce tele-handler dependency by enabling an intelligent agent-led tele-medical journey that captures customer disclosures, performs dynamic questioning, validates responses, and prepares a structured case for automated decisioning or referral.

Outcomes: STP | UW Review | Human Escalation

Agent Layer

- **Consent Agent** captures customer approval and manages entry into the workflow.
- **Interview Agent** conducts the baseline tele-medical questionnaire and maintains conversation context.
- **Reflexive Questioning Agent** dynamically probes disclosed conditions to collect sufficient underwriting information.
- **Validation Agent** identifies missing, inconsistent, or contradictory responses and seeks clarification.
- **Case Summary Agent** creates a standardized digital record for downstream evaluation.

Decision Layer

Applies underwriting logic to determine whether the case qualifies for Straight Through Processing (STP), requires Underwriting Review, or should be escalated for human intervention.

End-to-End Journey

Proposal enters tele-medical workflow → Consent captured → Questionnaire completed → Adaptive follow-up questioning performed → Responses validated → Digital case record generated → Automated decision recommendation produced.

Expected Benefits

Reduced operational effort, improved interview consistency, faster turnaround times, enhanced auditability, and increased opportunities for automated processing while retaining human oversight for exception cases.
